PMD70-pCool Safety Update – Precaution “Impact of defective components”

Dear customer,

The purpose of this statement is to inform you about the following, additional precaution note for chapter 3.1. “Warnings - Basics” of the PowerMAG Manual (510601).

High voltage
on the damaged coil

- **Danger to life! The stimulation coil must be carefully inspected for cracks or other damage before each use. The device may only be operated safely if the coil is in perfect condition! A defective coil can make life-threatening high voltages accessible during operation.**

In general, every TMS system consists of a high voltage generator (the energy source – the so called magnetic stimulator) emitting a high voltage (2,300 V) and high current (6,000 A) TMS pulse into the stimulation coil. Your TMS system is designed and manufactured compliant to several international electrical and medical safety standards. However, use of defective components / coils may lead to severe damage to the system and, as a consequence of continued operation, to a dangerous, life-threatening situation to patient and operator.

Defective coils can be identified by:

- Mechanical irregularities in the coil’s head or coil’s cable (e.g. dents, cuts)
- Visual signs of damaged contact pins within the stimulator socket or the coil plug (e.g. bent or burned golden pins)
- Leakage of the cooling medium (e.g. white wax-like residue)
- Increased (louder than usual) noise level of TMS pulses

If any of these signs can be observed

1. do not use the affected components anymore and
2. contact our support team at support@magandmore.com or +49 89 2018 5248.

My name is at MAG & More GmbH, the German manufacturer of your PowerMAG / Apollo TMS Therapy system. Safety is my highest priority – therefore we are emphasizing this aspect with this information, and we will update the Apollo manual accordingly.

Should you have any questions, remarks or concerns please do not hesitate to reach out to me by

Thank you.

Sincerely yours,

.....
